G/Croment: This protein mediates the motor neuron-induced aggregation of acetylcholine r C/Comment: D0% of rate embryonic transcripts encode the variant labeled below as form 3. Croment: 90% of rate embryonic transcripts encode the variant labeled below as form 3. ylcholine receptor clustering activity.

cadherin-related tumor suppressor precursor - fruit fly (Drosophila melanogaster)
Cispecies: Drosophila melanogaster
Cipate: 30.Sep-1993 #sequence_revision 30-Sep-1993 #text_change 16-Feb-1997
CiAccession: A41087; B41087
Rimahoney, P.A.; Weber, U.; Onofrechuk, P.; Biessmann, H.; Bryant, P.J.; Goodman, C.S.
Airle: The fat tumor suppressor gene in Drosophila encodes a novel member of the cadhe:

Patent No. 5814478

GENERAL INFORMATION:

TITLE OF INVENTION: NOVEL TYROSINE KINASE RECEPTORS

TITLE OF INVENTION: AND LIGANDS

NUMBER OF SEQUENCES: 32

CORRESPONDENCE ADDRESS:

ADDRESSEE: Regeneron Pharmaceuticals, Inc.

STREET: TAILYOWN

COUNTRY: USA

ZIP: 10591

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

## ALIGNMENTS

```
An assay for the diagnosis or assessment of the severity of osteoarthritis or rheumatoid arthritis comprising detecting an isomerized or optically inverted protein in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an assay for the diagnosis or assessment of the severity of osteoarthritis or rheumatoid arthritis. The assay involves measuring (in a biological sample) the amount or presence of an isomerised or optically inverted protein or one or more isomerised or optically inverted from proteins such as perlecan, biglycan, decorun, fibrillin-1 or protocadherin. The assay is useful for the diagnosis or assessment of the severity of osteoarthritis or rheumatoid arthritis. The present sequence is human perlecan protein
                                                                                                                                                             Human; diagnosis; osteoarthritis; rheumatoid arthritis; perlecan.
                                                                                                                                                                                                                                                                                                                                                                                          Cloos PAC;

The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polymolectide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the genglioside GMZ activator, calgranulin B or saposin B protein families. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immine disease. The polymucleotides and polypeptides are used for diagnosis, prognosis, proprecion and treatment of multiple sclerosis (in its various forms and passes). They may also be useful in cases of e.g. Alzheimer's and Parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including use as vaccines and in polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisenses sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells
                                                                                                                                           Detecting, preventing and treating degenerative, neurological and autoimmune diseases, particularly multiple sclerosis, using specified polypeptides or related nucleic acid or ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 BIKITFRPDSADGMLLYNGOKRVPGSPTNLANRQPDFISFGLVGGRPEFRFDAGSGMATI

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain recention (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed gene therapy techniques to restore normal activity of (II) be useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abstrant procein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the way way and the compact of the printed specification, but was obtained in the way and the compact of the printed specification, but was obtained in the way and sequences.

```
The present sequence represents a human polypeptide, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polymorleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the ganglioside GMZ activator, calgranulin B or saposin B protein the ganglioside GMZ activator, calgranulin B or saposin B protein camples. The method is used for describing or treating a degenerative, neurological and/or auto-immune disease. The polymucleotides and polypeptides are used for diagnosis, prognosis, proprosition and treatment of multiple sclerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimer's and Parkinson's diseases, amyotrophic lateral sclerosis, rheumatcid polyperthritis and lugus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisenses sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        690

proteins, and the polynucleotide sequences encoding them. The NOVX proteins of the invention are G-protein coupled receptor (GPCR) related proteins. The sequences of the invention are useful in the manufacture of a medicament for treating a syndrome related to a human disease associated with the polypeptides e.g. cancer. ABUS2311-ABUS240B represent the human NOVX proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HPTPLALGHFHTVTLLRSLTQGSLIVGDLAPVNGTSQGKFQGLDLNEELYLGGYPD---Y 118

The invention relates to new isolated NOVX polypeptides, the genes encoding them or sequences having at least 95% identity to the amino acid or nucleotide sequences. The NOVX polypeptide is useful as a therapeutic,

particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with NoVX polypeptide. The NOVX polypeptide is particularly useful for treating, preventing or alleviating pathology associated with NOVX polypeptide in a mammal, e.g. a human. The NOVX nucleic acid and polypeptide are especially useful for treating or preventing e.g. diabetes, obesity, cancers (e.g. lymphoma, uterus cancer or prostate cancers), dysliptidemiss, anorexia, wasting disorders, Altheimer's disease, parkinson's disorder, cachexia, cardiomyopathy, AIDS, asthma, Crohn's disease, multiple sclerosis, hypertension, atherosolerosis, hemophilia, graft-versus-host disease or Albright hereditary osteodystrophy. The DNA encoding the protein is useful in gene therapy for treating the above conditions. These are also useful in developing powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications. This sequence represents one of the NOVX proteins of the

The invention relates to new isolated NOVX polypeptides, the genes encoding them or sequences having at least 95% identity to the amino acid cor nucleotide sequences. The NOVX polypeptide is useful as a therapeutic, particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with NOVX polypeptide is particularly useful for treating, preventing or alleviating pathology associated with NOVX polypeptide in a mammal, e.g. a human. The NOVX nucleic acid and polypeptide in a mammal, e.g. a human. The NOVX nucleic acid and polypeptide are especially useful for treating or preventing e.g. diabetes, obesity, cancers (e.g. lymphoma, uterus cancer or prostate cancer), dyslipidemias, anorexia, wasting disorders, asthma. Crohn's disease, multiple solerosis, hypertension, atherosolerosis, hemophilia, cascoding the protein is useful in gane therapty for treating the above conditions. These are also useful in gane therapty for treating the above conditional analysis of various human disorders, as well as in diagnostic applications. This sequence represents one of the NOVX proteins of the
  New NOVX polypeptides and polynucleotides, useful in gene therapy, particularly for treating or preventing a syndrome associated with human disease e.g. diabetes, obesity, cancer, Alzheimer's disease, hypertension or hemophilia.
                                                                                                                                    Claim 1; SEQ ID NO 106; 748pp; English.

The present sequence is the protein sequence of Incyte polypeptide

2736276CD1 denoted human cell adhesion and extracellular matrix protein 8

(CADECM-8). The protein is encoded by a clone isolated from a soft tissue tumour cDNA library. The invention provides CADECM-1 to -11 polypeptides

(See ABP58224-34) and polynucleotides (see AB224578-88), vectors, host cells, antibodies, agonists and antagonists. These are useful for diagnosing, treating or preventing disorders associated with aberrant expression of CADECM, particularly cell proliferative disorders (e.g. arteriosclerosis, atherosclerosis, cirrhosis, hepatitis, paroxysmal nocturnal heemoglobiuuria, polycythaemia vera, psoriasis, primary thromobocytopaenia or cancer), developmental disorders (e.g. renal nocturnal namemia or mental retardation), neurological disorders (e.g. Alzheimer's disease, Parkinson's disease or epilepsy), reproductive disorders (e.g. infertility or a disruption in the menstrual cycle), or autoliditis, contact dermatitis, Crohn's disease, diabetes mellitus, glomenlonephritis, Goodpasture's syndrome, gout, Graves' disease, Hashimoto's thyroiditis, irritable bowel syndrome, multiple sclerosis, heumatoid arthritis, syndrome, undections theumatoid arthritis, syndrome, undections theumatoid arthritis, fungal, or viral, bacterial, fungal, parasitic, protezoal or helminthic infections \$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$

The invention relates to a novel isolated human neurotransmission-associated proteins (NTRAM) polypeptide. The polypeptide of the invention demonstrates cytostatic and immunomdulator activities and may be useful for preparing a composition for diagnosing or treating a disease or condition associated with decreased expression or overexpression of gene therapy procedures. The current sequence is that of the human NTRAM protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human neurotransmission-associated proteins (NTRAN) polypeptide, useful for preparing a composition for treating a disease associated with decreased expression or overexpression of NTRAN e.g., cancer.
